Applicant		TAKATA-PETRI	AG	
 This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36. 				
2. This REPORT consists of a total of5 sheets, including this cover sheet.				
This report is also accompanied by ANNEXES, i.e., sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rul 70.16 and Section 607 of the Administrative Instructions under the PCT).				
These annexes consist of a total of sheets.				
3. This report co	ntains indications relating to	the following items:		
ı 🖂	Basis of the report			
п	Priority			
ш			ty, inventive s	tep and industrial applicability
IV Lack of unity of invention		aventive stan or industrial applicability		
v ⊠	V Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement			hyennive step of industrial approximity,
VI Certain documents cited				
VII Certain defects in the international applica		rnational application

Citations and explanations

Reference is made to the following documents:

D1: PATENT ABSTRACTS OF JAPAN Vol. 008, No. 061 (M-284),
23 March 1984 (1984-03-23) & JP 58 211975 A (NISSAN
JIDOSHA KK), 9 December 1983 (1983-12-09)

D1 is considered the prior art closest to the subject matter of claim 1. D1 discloses (cf. the abstract and figures) an arrangement which, in the event of a crash, in order to reduce the energy produced on impact with a person located outside the vehicle, deflects part of the motor vehicle outer skin formed by a bonnet 1 as a result of a movement of the bonnet 1 counter to the deflection direction, said arrangement having a system 3 for deflecting the bonnet 1, which system acts at a point 6 of the bonnet 1 and which, when a person impinges on the bonnet 1, allows the latter to move counter to the deflection direction, the point of impact of the deflection system 3 being provided in the region of an end 11, of the bonnet 1, associated with the passenger cell.

Therefore the subject matter of claim 1 differs from the known arrangement in that the deflection system comprises an element which, on impact between a person and the deflected part during which the impact forces act counter to the deflection direction, can counteract a movement of the part of the outer skin counter to the deflection direction, in order to prevent said movement, and in that the deflection system is controlled as a function of the time, place and/or direction of the impact such that, depending on the time and/or place and/or direction of the impact on the deflected part of the outer skin, the deflection system permits a movement of the part of the outer skin counter to the deflection direction or counteracts such a movement, in order to prevent it.

Consequently the subject matter of claim 1 is novel (PCT Article 33(2)).

The problem to be solved by the present invention can thus be considered that of preventing the bonnet from being depressed owing to the impingement of the upper body.

For the following reasons, the solution to this problem proposed in claim 1 of the present application involves an inventive step (PCT Article 33(3)):

The deflection arrangement can decide spatially or chronologically between impact with the upper body and impact with the head and, in the event of impingement of the upper body on the deflected part, counteracts a movement of the bonnet counter to the deflection direction by means of the element, although the impact forces act counter to the deflection direction.

TERNATIONAL I REDIVINGE 222	101/22
Claims 2 to 41 are dependent on claim 1 meet the PCT novelty and inventive step	and hence likewise requirements.
